

The Effect of Organizational Learning on Organizational Commitment, Job Satisfaction and Work Performance among University Teachers of Kashmir Region

Samreena Hamid Marazi

Department of Commerce, University of Kashmir Srinagar (India)

ABSTRACT

The literature review reveals that there is a relationship between organizational learning organizational commitment, job satisfaction and work performance among university teachers of Kashmir region. However, it is apparent that the integrated relationships between these variables have not been found to be reported. Hence, we examine the relationship among these variables using a sample of university teachers of Kashmir region. Organizational learning was found positively related to organizational commitment, job satisfaction, and work performance. Organizational commitment and job satisfaction are also positively related with work performance and these variables partially mediate the relationship between organizational learning and work performance. Implication of the study and suggestions for future research been discussed in this paper.

Keywords: organizational learning, organizational commitment, job satisfaction, work performance, University Teachers, Kashmir Region

I. INTRODUCTION

Organizational learning is more of a need than a choice at the present time. It is almost impossible to notice organizations that will admit to ignoring learning, since this would be akin to be accepting the start of its demise (Montes, Moreno and Morales, 2005; Probst and Buchel, 1997). Organizational learning is considered by many a core capability of an effective organization and a key element of a strategy for corporate renewal (Spicer and Sadler-Smith, 2006). Long-term survival, competitiveness and achieving greater performance all depend on the organizations' capacity to match the continuous changes in the environment (Montes et al., 2005). Realizing the importance of organizational learning, it has recently commanded a great deal of attention. As a result, the concept of organizational learning has achieved prominence amongst the ideas, which now influence management studies. Although links between learning and positive work outcomes have often been assumed, there is little empirical evidence to support this perspective (Lopez, Peon and Ordas, 2005). Spicer and Sadler-Smith (2006) contend that the investigation on organizational learning have failed consistently in demonstrating its impact on organizations. They further pointed that the field has suffered from a dearth of empirical evidence to support the assertion that there is a positive relationship between organizational learning and performance based outcomes.

Conversely to Watkins and Marsick (2003), researchers are in the relatively early stages of exploring learning organization constructs and developing measurement approach. These early studies and adoption of learning organization principles in practice have led to growing interactions between organizational learning culture and organizational outcomes (Egan, Yang, and Bartlett, 2004). Although organizational learning theories and practices have been clarified by practitioners and scholars over the past several years, there is much to be explored regarding interaction in organizational learning culture, employees learning and organizational outcomes (Egan et al., 2004), especially in the public services sector. Noticeably the impact of workplace learning on job satisfaction (Rowden and Conine, 2005; Cropanzano and Byrne, 2001) and organizational commitment (Mohammed and Marquardt, 2007) not been explored adequately in the public sector.

In many ways, the education sector is the most natural place to establish a culture of learning. Primary education is compulsory for all citizens, boys or girls, and is offered the change in university culture. The ministry of national education is responsible for the administration of education and the enforcement of educational laws.

The universities is, after all, a trust with the concepts of truthful gaining the knowledge. As such educational quality and success of reforms are mainly dependent on teachers who carry out the tasks and educational activities in schools (tsui and cheng 1999). Against this background, the need for organizational learning is clearly important in the universities in Kashmir. The belief that the implementation of organizational learning in the universities.

Realizing the deficiency in the literature pertaining to the relationship between organizational learning, organizational commitment, job satisfaction, and work performance in specific to universities, an empirical study been carried out to provide new insights to the body of knowledge. In this paper, we report the following: 1) the extent organizational learning explains organizational commitment, job satisfaction and work performance; 2) the extent organizational learning, organizational commitment and job satisfaction explain work performance; 3) the role of organizational commitment and job satisfaction as mediating variables on the relationship between organizational learning and work performance.

II. REVIEW OF LITERATURE

In recent years, performance management has come to the fore as organizations seek constantly to optimize their human resources in the face of growing competitive pressures (Suliman, 2001). The general consensus in the learning organization literature is that learning at the organizational level is a prerequisite for successful organizational change and performance (Garvin, 1993; Hendry, 1996). According to Watkins and Marsick (1996) learning could enhance the intellectual capabilities of the employees; as such organizations will eventually be better off through having learned employees. Organizational learning can be regarded as a dynamic process of creation, acquisition and integration of knowledge aimed at development of resources and capabilities that contribute to better performance (Chonko et al., 2003; Choe, 2004; Gonzales, 2001; Lopez et al., 2005; Wu and Cavusgil, 2006).

Garver (1996) shows that there is significant positive relationship between measure of learning activities and performance at work indicating higher performers are involved in greater volume of learning activities. Jashapara (1993) reported that learning in an organization have a positive impact on organizational performance. Skerlavaj, Stemberger, Skrinjar and Dimovski (2006) reported from their study that organizational learning has a positive direct impact on performance. The finding from the study conducted by Spicer and Sadler-Smith (2006) in small manufacturing firms also indicates that organizational learning has a positive relationship with financial and non-financial performance of the firms. Similarly many other empirical studies indicated positive relationship between organizational learning and performance outcomes (Correa, Morales, and Pozo (2007) Ellinger et al., 2003; Jimenez and Navarro (2006) Khandekar and Sharma (2006) Power and Waddell (2004) Schroeder, Bates, and Junttila, 2002)

The organizations with the greatest harmony between organizational and individuals goals are those that are sensitive to individuals and provide them with the resources and opportunities for learning and achievement (Rowden and Conine, 2005). Organizations that have made learning, education, and development a priority have seen it pay off through greater profitability and increased employees' job satisfaction (Leslie et al., 1998). Rowden and Conine (2005) examined the impact of workplace learning on job satisfaction in small US commercial banks and reported significant relationship between workplace learning and employees' job satisfaction. According to them, large part of job satisfaction can be attributed to the availability of on the job learning opportunities. Egan et al., (2004) also reported that organizational learning culture positively correlates with employees' job satisfaction. Bromfield-Day (2000) reported from her study that there is positive relationship between employee readiness's for self-directed learning with job satisfaction.

In addition to the conceptual and theoretical arguments, there have been a number of empirical studies in support of the relationship between job satisfaction and work performance (Judge et al., 2001; Politis, 2005; Suliman and Iles, 2000; Wilson and Frimpong, 2004; Yousef, 1999). Research shows that employees who experience job satisfaction are more likely to be productive and stay on the job (McNeese-Smith, 1997). The job satisfaction experienced by employees will affect the quality of service they render (Crossman and Abou-Zaki, 2003) and in turn will affect their work performance. The apparent logic is that employees who are satisfied with their job tend to be cooperative, helpful, respectful and considerate, hence deliver an excellent job (Wilson and Frimpong, 2004). Besides job satisfaction, organizational commitment has been studied extensively during the last three decades (Kontoghiorphes and Bryant, 2004). According to Bartlett (2001), much of the interest in organizational commitment stems from reports of positive consequences on employee's behaviour and desirable work outcomes from organizational commitment. Today, the aspect of organizational commitment is even more important since it is considered as the driving force behind an organization's performance (Kamarul and Raida, 2003). Interests in work related commitment have been sparked by its potential benefits to individuals and organizations (Somers and Birbaum, 2000). It is also an important variable in explaining work-related behaviour and its impact on performance (Benkoff, 1997). Organizational commitment can also be viewed as a dimension of organization effectiveness through work performance and reducing turnover (McDermontt, Laschinger and Shamian, 1996). Many past studies

reported positive relationship between organizational commitment and work performance (Arnett, Laverie and McLane 2002; Suliman and Iles, 2000; McNeese-Smith, 1997).

Organizational commitment in relation to job satisfaction has also received considerable attention in past studies and the findings signify positive association between the two variables (Bhuiyan and Abul-Muhmin, 1997; Yousef, 2002; Yavas and Badur, 1999). Various studies have also discovered positive relation between organizational commitment and job satisfaction and organization's competitiveness (Liou, 1995; Baugh and Roberts, 1994). Indeed organizational commitment and job satisfaction are common variables that affect organizational outcomes (Testa, 2001). Russ and McNeilly (1995) conducted a study to examine the relationship between organizational commitment and job satisfaction using experience, gender and performance as moderators. They reported that experience and performance moderate the relationship between organizational commitment and job satisfaction. Conversely study conducted by Curry, Wakefield, Price and Mueller (1986) reveals no significant relationship between job satisfaction and organizational commitment. Wright (1997) conducted a study to examine the effects of organizational learning and individual learning on job satisfaction and organizational commitment. The results revealed that job satisfaction and organizational commitment strongly influenced by organizational learning. Yeo (2002) proposed that single-loop, double-loop and deutero-loop learning will ultimately result in a positive attitude and work commitment among individuals, hence helping organizations perform better in the long run.

Many studies have been done to test the role of organizational commitment (Suliman, 2002; Norris-Watts and Levy, 2004; Yousef, 2000; Cropanzano et al., 1993) and job satisfaction (Lok and Crawford, 2001; Yousef, 2002; Cropanzano et al., 1993; Chiu and Francesco, 2003) as mediating variables, but to the best of researchers' knowledge, no study been reported specifically on the role of organizational commitment and job satisfaction as mediating variable on the relationship between organizational learning and work performance. Besides, Wright, (1997), Yang et al. (2003), Wang, (2005) have studied the relationship between organizational learning and job related attitude (organizational commitment and job satisfaction) of employees, but these studies did not link these factors to the employees' performance. The lack of attention given to the possible influence of this matter in the previous studies has highlighted a significant issue that requires further investigation. Hence, we attempted a research with aims to produce an integrated study to cover the gaps identified in the literature and extend earlier research on organizational learning, commitment, and job satisfaction and work performance among public service managers in Malaysia.

III. RESEARCH METHOD

The primary data was obtained through a survey using self-administered questionnaire. Items from established instruments were adopted and modified appropriately to suit the objectives of the study. Organizational learning was measured using 16 items developed by Gomes et al. (2005), 10 item developed by Porter et al. (1974) used to measure organizational commitment, job satisfaction was measured using 12 items from Hackman and Oldham (1975) and work performance was measured using 15 items developed by Suliman (2001). The respondents were asked to respond on a scale ranging from strongly disagree (1) to strongly agree (7). From the analysis, it was identified that the Cronbach alpha of all constructs were between 0.84-0.94, exceeding Nunnally's (1978) recommended threshold value of 0.7. Thus, the instrument used in this study showed a good level in terms of reliability. The last part of the questionnaire collected the demographic information such as respondents' age, gender, educational level, and work experience. The choices are classified and respondents are required to choose the ones that are most applicable to them.

The respondents were chosen by systematic sampling procedure. 500 questionnaires were personally distributed to university professors in Kashmir university teachers. A total of 435 (87%) fully answered questionnaires were received from the respondents. The Statistical Package for Social Science (SPSS version 14) and Analysis of Moment Structures (AMOS version 6) were used to analyze the collected data.

IV. FINDINGS AND DISCUSSION

Respondents' background

Majority of the respondents (64%) are male. In terms of age distribution, 63% of the respondents were less than 40 years old, 20% were between the ages of 41 to 50 years, and 17% of the respondents were 51 years and above. The wide age range indicates a diverse sample. From the data on educational level, 50% of the respondents were masters, 29% were NET/SET, and only 30% had obtained PhD qualification. For profession ranking of the respondents, 52% are assistant professors, 41% associate professors and 7% professors. In term of work experience, 56% of the respondents had less than 10 years' work experience, 8% had 11 to 15 years work experience, and 36% had 16 years or more work experience. The following subsection discussed the relationship and mediating effects between the constructs.

Organizational Learning and Work Performance

From Table 1 and based on Cohen (1988) guideline, there is a positive moderate relationship at the corrected alpha ≤ 0.0125 level between organizational learning and work performance ($r = .484$, $n = 435$, $p \leq 0.0001$). The result indicates that organizational learning has a positive moderate linear relationship with work performance. Improvement in the organizational learning activities among the university teachers increases knowledge, improves capabilities and skills thereby enhance their work performance. The present result supports the findings of earlier studies (Correa, Morales, and Pozo, 2007; Ellinger et al., 2003; Garver, 1996; Jashapara, 1993; Jimenez and Navarro, 2006; Khandekar and Sharma, 2006; Power and Waddell, 2004; Schroeder, Bates, and Junttila, 2002; Skerlavaj, Stemberger and Dimovski, 2006; Spicer and Sadler-Smith, 2006). This research further confirms the belief of most teachers that organizational learning is a powerful tool to improve performance (Gonzales, 2001). Thus, combined with evidences from the earlier studies linking organizational learning with performance, the findings of this present study support the common and popular argument that learning facilitates behavioral change, increases efficiency and effectiveness of the university teachers and facilitates the achievement of organizational goals and objectives.

Organizational Learning and Organizational Commitment

There is a high positive relationship at the corrected alpha ≤ 0.0125 level between organizational learning and organizational commitment ($r = .561$, $n = 435$, $p \leq 0.0001$). The result indicates that organizational learning has a positive strong linear relationship with organizational commitment. With improvement in the organizational learning activities, organizational commitment among the university teachers increases. This finding supports the research result of Wright (1997) where organizational commitment was found influencing organizational learning. The present findings also similar to the study conducted by Wang (2003) to examine the relationship among organizational learning culture, job satisfaction, and organizational commitment in native Chinese enterprise settings and the results revealed that organizational learning has significant moderate relationship with organizational commitment. The study conducted by Ng et al (2006) indicated that opportunity for learning positively effects employees' commitment towards the organization. Yang et al., (2003) examine the dynamic relationships among organizational learning, job satisfaction, and organizational commitment in a Korean context and reported that the three variables concerned were correlated. This result is parallel with the idea proposed by Yeo (2002) that the consequence of organizational learning and the characteristics of a learning organization are antecedents to organizational commitment.

These results support the idea, that, increased organizational commitment is one of the benefits of employee training (Philips, 1997) or learning. Many studies have also reported the positive relationship between training and organizational commitment of the employees (Bartlett, 2001; Grossberg, 2000; Mohammed and Marquardt, 2007). According to Ng et al. (2006) acquiring knowledge and skills through learning often benefits one's career and is likely to be rewarded by promotions opportunity, higher salary and many other employees' benefits. Therefore, learning is increasingly valued by individuals as it may affect their career attainments and the subjective evaluations of their careers. They further asserted that because the opportunity for learning at work is increasingly desired by employees today, its provision should help elicit employees' perceptions of a quality relational exchange with their employers which will be reciprocated in terms of organizational commitment.

Organizational Learning and Job Satisfaction

There is a positive high linear relationship at the corrected alpha ≤ 0.0125 level between organizational learning and job satisfaction ($r = .551$, $n = 435$, $p \leq 0.0001$). Improvement in organizational learning activities increases job satisfaction among the university teachers in Kashmir. This finding is in line with research result conducted by Wright (1997), and Egan et al. (2004) where they reported that organizational learning is associated with employees' job satisfaction. Result of the study by Egan et al. (2004) suggests that organizational learning is associated with job satisfaction and although these constructs are highly correlated, they tend to be conceptually distinct. Yang et al. (2003) reported that organizational learning culture acted as a predictive variable to the job satisfaction variable. Wang (2005) reported in his study that organizational learning culture has positive strong relationship with employee job satisfaction. According to Watkins and Marsick (2003), organizations that have prioritized learning and development have found increase in employees' job satisfaction, productivity, and profitability. This statement is further echoed by Rowden and Conine (2005). According to them, organizations that have made learning a priority have seen the payoff through greater employees' job satisfaction. The present finding simply means that the more the managers are involved in the learning activities, the more they are satisfied with their job, the more they are committed to their organizations, and the better their performance in their job.

V. ORGANIZATIONAL COMMITMENT, JOB SATISFACTION AND WORK PERFORMANCE

Table 1 indicate a positive strong linear relationship at the corrected $\alpha \leq 0.0125$ level between organizational commitment and work performance ($r = .535$, $n = 435$, $p \leq 0.0001$). With improvement in the organizational commitment, therefore it increased work performance among university teachers in Kashmir. Table 1 also indicate a positive moderate linear relationship at the corrected $\alpha \leq 0.0125$ level between job satisfaction and work performance ($r = .512$, $n = 435$, $p \leq 0.0001$). This clearly indicates that satisfied employees perform better on their job and vice versa. The results of this study provide support to the earlier studies that organizational commitment has positive relationship with teachers' performance (e.g. Arnett et al., 2002; Suliman and Iles, 2000). The same results occur for the relationship between job satisfaction and managers performance (e.g. Judge et al., 2001; Politis, 2005; Suliman and Iles, 2000; Wilson and Frimpong, 2004; Yousef, 1999). The findings of this study support the view of Testa (2001) that organizational commitment and job satisfaction affects organizational outcomes such as work performance.

VI. ORGANIZATIONAL COMMITMENT AS MEDIATOR

The results shown in Table 2 indicate that all the conditions as advocated by Baron and Kenny (1986) were met. The first equation shows that organizational learning is significantly affected by organizational commitment ($t = 14.090$; $p = 0.0001$). The second equation shows that the organizational learning significantly affects the work performance ($t = 11.517$; $p = 0.0001$) and the third equation reveals that organizational commitment has a significant unique effect on work performance ($t = 8.103$; $p = 0.0001$). The beta value in the second equation (0.484) was larger than the beta value in the third equation (0.384). Organizational learning (antecedent) predicts organizational commitment, and organizational commitment in turn predicts the work performance (consequence) teachers of the Kashmir University. Therefore, in this study it can be concluded that organizational commitment partially mediates the relationship between organizational learning and work performance.

The finding is in line with the study result conducted by Suliman (2002). The findings of the study indicate that organizational commitment plays a partial role as mediator on the relationship between work climate and immediate supervisor rated performance. In other words, organizational commitment does not fully mediate the relationship between work climate and performance. The results indicate that the employees who perceived their work climate positively tend to show higher levels of performance, because they were highly committed. On the other hand, employees who reported less positive perception of the work climate are found to be less committed, and as a result they report lower levels of performance (Suliman, 2002). Yousef (1999) concluded from his study that organizational commitment mediates the relationship between leadership behavior and job performance. The result of this study in terms of the mediating role of organizational commitment in the relationship between organizational learning and work performance is consistent with the theoretical literature. This finding is consistent and further confirms the results of many studies that one of the most important characteristics of organizational commitment is the mediating role it plays in work organizations (Davy Kinichi & Scheck, 1997; Thompson and Warner, 1997; Allen and Rush, 1998).

VII. JOB SATISFACTION AS MEDIATOR

The results from Table 3 indicate that all the conditions as advocated by Baron and Kenny (1986) were met. The result in the first equation indicates that organizational learning significantly affects job satisfaction ($t = 13.757$; $p = 0.0001$). In the second equation, organizational learning significantly affects work performance ($t = 11.157$; $p = 0.0001$) and in the third equation job satisfaction has a significant unique effect on work performance ($t = 7.392$; $p = 0.0001$). The beta value in the second equation (0.484) is larger than the beta value in the third equation (0.351). Therefore, in this study it can be concluded that job satisfaction partially mediates the relationship between organizational learning and work performance. Organizational learning (antecedent) predicts job satisfaction, and job satisfaction in turn predicts the work performance (consequence) university teachers in the Kashmir division. This finding is in line with the results from the study conducted by Lok and Crawford (2001) which indicates that job satisfaction play a partial role as mediator between independent and dependent variables. They reported that a significant proportion of the effects of the antecedents on commitment operated directly on commitment rather than indirectly via their effect on job satisfaction. Chiu and Francisco (2003) reported that job satisfaction mediates the relationship between dispositional traits and turnover intention. The result confirms the role of job satisfaction as a mediating variable in this study. The finding from the study conducted by Carmeli and Freund (2004) indicated that job satisfaction had a mediating role in the relationship between commitment and job performance. Yousef (2002) reported in his study that job satisfaction mediated the influences of role conflict and role ambiguity on various facets of organizational commitment, except continuance commitment and high personal sacrifice. The study conducted by Egan et al. (2004) also revealed that organizational learning activities had an indirect effect on employees' turnover intention and this effect was mediated by job satisfaction. Similar results were also been reported on the role of job satisfaction as mediator by Iverson and Roy (1994), Michaels (1994), and Politis (2005)

CONCLUSION

The results of the study suggest that organizational learning plays an important role and significantly contributes to organizational commitment, job satisfaction, and work outcomes of teachers in universities. Besides, the findings present empirical evidence that organizational commitment and job satisfaction partially mediate the relationship between organizational learning and work performance of the teachers of university in Kashmir. The result of the present this study contributes to the literature on organizational learning and work outcomes from the university teachers from Kashmir. More specifically this study enhances and supports the findings of the earlier research regarding the role of organizational commitment and job satisfaction as mediator variables. This study represents original research of these mediating effects.

LIMITATION AND SUGGESTION FOR RESEARCH

One of the limitations of the current study relates that only university teachers are observed. It has to be noted that self-reported measures might not exactly or truly reflect the subject of interest. Therefore, future studies should use both objective and perceptual measures of performance, making it possible to compare respondents' perceptions of results against the real findings. This would allow drawing more reliable conclusions about the influence of organizational learning on positive work outcomes. This study only involved university teachers; thus, this study should be replicated to cover a wider sampling frame that is representative of general education sector. Future research need to explore and validate the relationship between the variables concerned by examining data from other public service schemes such as engineers, health workers, arm forces and many others. The sample of the study only includes professors and assistant professors universities. Therefore, the outcomes of this study are relevant and may be applicable to the universities only. The present study attempts to fill the gaps identified in the previous study and expects to provide new insights to the body of knowledge. The outcomes of this study may also instigate and allow others to conduct research on other factors or elements that may possibly affect the relationship between organizational learning and work outcomes.
