#### Abstract

Let $G$ be a $(p, q)$ graph. A $(p, q)$ graph is a graph with $p$ vertices and $q$ edges. Let us definean injection mapping $f: V(G) \rightarrow\{1,2, \ldots, p+q\}$, for each edge $e=u v$ in E labeled by, $$
\begin{gathered} f^{*}(e)=\frac{\frac{f(u)+f(v)}{2}}{f^{2}} \quad \text { if } f(u)+f(v) \text { is even } \\ f^{2} \end{gathered} \text { if } f(u)+f(v) \text { is odd }
$$

Then $f$ is said to be super mean labeling if the set $f(v) \cup\left\{f^{*}(e): e \epsilon E\right\}=\{1,2, \ldots, p+q\}$. The graph which admits super mean labeling is called super mean graph. In this paper we have found out the Super Mean Labeling of Line and middle Graph of Pathand Cycle. Keywords: Super Mean Labeling, Line graph of path with $n$ vertices - $L\left(P_{n}\right)$, Line Graph of cycle with nvertices - 

\section*{INTRODUCTION}

A graph G is a combination of vertices and edges which are connected to each other.Let $\mathrm{G}(\mathrm{V}, \mathrm{E})$ be a graph with vertex set V and the edge set E , respectively. By a graph $\mathrm{G}=(\mathrm{V}, \mathrm{E})$ we mean a finite undirected graph with neither loops nor multiple edges. In this paper $V(G)$ is the vertex setand $E(G)$ is the edge set of a graph $G$.

The number of vertices of G is called order of G and it is denoted by $p$. The number of edges of G is called size of G and it is denoted by $q$. $\mathrm{A}(p, q)$ graph G is a graph with $p$ vertices and $q$ edges.Terms and notations no defined here are used in the sense of Harary[1].

A graph labeling is the assignment of labels traditionally represented by integers,to verticesand/or edges of a graph. We have different methods of labeling.

Graph labeling was first introduced in the late 1960's. Many studies in graph labeling was madewhich refers to Rosa's research and that was held in 1967[6].

In 2003, Somasundaram and Ponraj [2] have introduced the notation of Mean Labelingof graphs. The concept of Super Mean Labeling was introduced by Ponraj and Ramya [3].Furthermore some results on super mean graphs are discussed in[7-11]. B. Gayathri and M. Tamilselvi[12,13] extended super mean labeling to k-super mean labeling.

In 2018, NurInayah, I.WayanSudarsanaSelvyMusdalifah, and Nurhasanah Daeng Mangesa haveintroduced the notion of Super Mean Labeling for Total Graph of Path and Cycle[4].

## Preliminaries:

## Definition 1:

Let G be a $(p, q)$ graph. A graph G is called a mean graph if there is an injective function $f$ from the vertices of G to $\{0,1,2, \ldots, q\}$. Such that when each edge $e=u v$ is labeled with

$$
f^{*}(e)=\left\{\frac{f(u)+f(v)}{f(u)+f(v)} \text { if } f(u)+f(v)\right. \text { is even }
$$

1 Then the resulting edge labels are distinct. Definition 2:

Let $f: V \rightarrow\{1,2, \ldots . p+q\}$ be an injection on $G$. For each edge $e=u v$ and an integer $m \geq 2$, the induced Smarandachely edge m-labeling $f$ is defined by

$$
f^{*}(e=u v)=\frac{f(u)+f(v)}{m}
$$

Then $f$ is called a Smarandachely super m-mean labeling if
$f(v) \cup\left\{f^{*}(e): e \epsilon E\right\}=\{1,2, \ldots, p+q\}$.
A graph that admits super mean m-labeling is called Smarandachely m-mean graph.Particularly, if $\boldsymbol{m}=\mathbf{2}$, we know that,

$$
\begin{aligned}
& f^{*}(e=u v)=\begin{array}{l}
\frac{f(u)+f(v)}{\frac{f(u)+f(v)+1}{2}}
\end{array} \text { if } f(u)+f(v) \text { iseven } \\
& \left.\frac{1}{2} \text { if } u\right)+f(v) \text { isodd }
\end{aligned}
$$

Such a labeling $f$ is called super mean labeling of G if

$$
f(V) \cup\left\{f^{*}(e): e \in E\right\}=\{1,2, . ., p+q\}
$$

A graph that admits super mean labeling is called super mean graph.

## Definition 3:

The Line Graph $L(G)$ of $G$ is the graph with vertices are the edges of $G$ with two vertices ofL(G) adjacent whenever the corresponding edges of $G$ are adjacent[5].

## Definition 4:

The Middle Graph $M(G)$ is defined as follows[5]. The vertex set $M(G)$ is $V(G) U E(G)$. Twovertices $X, Y$ in the vertex set $\mathrm{M}(\mathrm{G})$ are adjacent in $\mathrm{M}(\mathrm{G})$ in case one of the following holds:
i. $\quad X, Y$ are in $E(G)$ and $X, Y$ are adjacent in $G$.
ii. $\quad X$ is in $V(G), Y$ is in $E(G)$, and $X, Y$ are incident in $G$.

## On Super Mean Labeling for Line Graph of Path:

The theorem proposed in this section deals with the super mean labeling for line graph of pathon n vertices, $L\left(P_{n}\right)$.

## Theorem 1:

The line graph of path on $n$ vertices, $L\left(P_{n}\right)$ is a super mean graph for all $n \geq 3$.

## Proof:

Let $V\left(L\left(P_{n}\right)\right)=\left\{u_{i}: 1 \leq i \leq n-1\right\}$ and $E\left(L\left(P_{n}\right)\right)=\left\{e_{i}, 1 \leq i \leq n-2\right\}$ with $\mathrm{e}_{\mathrm{i}}=\mathrm{u}_{\mathrm{i}} \mathrm{u}_{\mathrm{i}+1}$
for $1 \leq i \leq n-2$. Immediately, we have that the cardinality of the vertex set and the edge set of
$L\left(P_{n}\right)$ are $P=n-1$ and $q=n-2$ respectively, and so $p+q=2 n-3$. Define an injection $f: V\left(L\left(P_{n}\right)\right) \rightarrow\{12, \ldots 2 n-2\}$ for $n \geq 3$ as follows:

$$
f\left(u_{i}\right)=2 i-1 \text { for } i=1,2, \ldots n-1
$$

And so we
have, $\quad f^{*}\left(e_{i}\right)=2 i \quad$ for $i=1,2, \ldots, n-2$

Next, we consider the following sets:

$$
\begin{array}{ll}
A_{1}=\left\{f\left(u_{i}\right)=2 i-1 \text { for } i=1,2, \ldots n-1\right\} \mathrm{A}_{2}= \\
\left\{f^{*}\left(e_{i}\right)=2 i\right. & \text { for } i=1,2, \ldots, n-2\}
\end{array}
$$

It can be verified that $f\left(V\left(L\left(P_{n}\right)\right)\right) \cup f^{*}\left(E\left(L\left(P_{n}\right)\right)\right)=\mathrm{U}^{2} \quad A_{i}=\{1,2, \ldots, n-1\}$ and so $f$ is a super mean labeling of $L\left(P_{n}\right)$. Hence $L\left(P_{n}\right)$ is a super mean graph. $=1$

## On Super Mean Labeling for Line Graph of Cycle:

The theorem proposed in this section deals with the super mean labeling for line graph of cycleof n vertices, $L\left(C_{n}\right)$.

## Theorem 2:

The line graph of cycle on $n$ vertices, $L\left(C_{n}\right)$, is a super mean graph if either $n$ is odd and $n \geq 3$ or $n$ is even and $n \geq 6$.

## Proof:

Let $V\left(L\left(C_{n}\right)\right)=\left\{u_{i}: 1 \leq i \leq n\right\}$ and $E\left(L\left(C_{n}\right)\right)=\left\{e_{i}, 1 \leq i \leq n\right\}$ with

$$
e^{e_{i}}=\left\{\begin{array}{cl}
u_{i} u_{i+1} & \text { for } 1 \leq i \leq n-1 \\
u_{i} u_{1} & \text { for } i=n
\end{array}\right.
$$

Immediately, we have that the cardinality of the vertex set and the edge set of $L\left(C_{n}\right)$ are $=$ $n$ and $q=n$ respectively, and so $p+q=2 n$.

Define an injection $f: V\left(L\left(C_{n}\right)\right) \rightarrow\{1,2, \ldots, 2 n\}$ for odd and $n \geq 3$ as follows.

$$
\begin{gathered}
f\left(u_{i}\right)=\left\{\begin{array}{c}
\text { for } i=1,2, \ldots \\
n+1
\end{array} \quad \frac{-}{2}+1, \ldots, n\right.
\end{gathered}
$$

And also we have,

Next, we consider the following sets,

$$
\begin{aligned}
& A_{1}=\left\{f\left(u_{i}\right)=2 i-1 \text { for } i=1,2, \ldots, \frac{n+1}{2}\right\} \\
& \begin{array}{rl}
A_{2} & =\left\{f\left(u_{i}\right)=2 i \text { for } i=\frac{n+1}{2}+1, \ldots, n\right\} \\
A & =\left\{f^{*}(e)=2 i \text { for } i=1,2, \ldots, \frac{n-1}{2}\right\} \\
3 & i
\end{array} \\
& \begin{array}{l}
A=\left\{f^{*}(e)=2 i+1 \text { for } i=n+1\right. \\
4 \\
\quad i
\end{array} \\
& A_{5}=\left\{f^{*}\left(e_{i}\right)=n+1 \text { for } i=n\right\}
\end{aligned}
$$

It can be verified that $f\left(V\left(L\left(C_{n}\right)\right)\right) \cup f^{*}\left(E\left(L\left(C_{n}\right)\right)\right)=\mathrm{U}^{5} \quad A_{i}=\{1,2, \ldots 2 n\} \quad$ and so f is a super mean labeling of $L\left(C_{n}\right)$. Hence $L\left(C_{n}\right)$ is a super mean labeling for $l$ line graph of cycle when $n$ isodd and $n \geq 3$.

Now define an injection $f_{1}: V\left(L\left(C_{n}\right)\right) \rightarrow\{1,2, \ldots 2 n\}$ for $n$ is even and $n \geq 6$ as follows

$$
\begin{array}{cc}
\begin{array}{c}
2 i-1
\end{array} & \text { for } i=1,2 \\
3 i-3 & \text { for } i=3,4 \mathbf{I} \\
f_{1}\left(u_{i}\right)= & \text { for } i=5, \ldots,{ }_{2}+1
\end{array}
$$

$$
2 i+2 \quad \frac{n}{2}+2, \ldots, n-1
$$

$$
{ }_{\mathbf{I}} \quad 7 \quad \text { for } i=n
$$

$$
\begin{aligned}
& f^{*}\left(e_{i}\right)=\quad \text { for } i=1,2, \ldots, \quad \frac{n-1}{2} \\
& n+1 \\
& \begin{array}{lll}
2 i+1 & \text { for } i= & , \ldots n-1 \\
n+1 & \text { for } i=n &
\end{array}
\end{aligned}
$$

And also we have,

$$
\begin{array}{cl}
\begin{array}{c}
2 \\
f^{*}\left(e_{i}\right)= \\
3 i-1
\end{array} & \text { for } i=1 \\
\mathbf{I}_{2 i+2} i=2,3 \\
2 i+3 & \text { for } i=4, \ldots \quad \frac{n}{2} \\
\text { for } i=\begin{array}{l}
n \\
2
\end{array}+1, \ldots, n-2 \\
\text { I } n+4 & \text { for } i=n-1 \\
\text { I } 4 & \text { for } i=n
\end{array}
$$

Next we consider the following sets,

$$
\begin{aligned}
& A_{1}=\left\{f_{1}\left(u_{i}\right)=2 i-1 \text { for } i=1,2\right\} \\
& A_{2}=\left\{f_{1}\left(u_{i}\right)=3 i-3 \text { for } i=3,4\right\} \\
& A_{3}=\left\{f_{1}\left(u_{i}\right)=2 i+1 \text { for } i=5, \ldots,{ }_{2}+4\right\} \\
& A=\left\{f(u)=2 i+2 \text { for } i={ }^{n}+2, \ldots, n-1\right\} \\
& \begin{array}{llll}
4 & 1 & i & \text { 2 }
\end{array} \\
& \begin{array}{cc}
A_{5}=\left\{f_{1}\left(u_{i}\right)=7\right. & \text { for } i=n\} \\
A_{6}=\left\{f^{*}\left(e_{i}\right)=2\right. & \text { for } i=1\} \\
A_{7}=\left\{f_{1}^{*}\left(e_{i}\right)=3 i-1\right. & \text { for } i=2,3\}
\end{array} \\
& A_{7}=\left\{f_{1}\left(e_{i}\right)=3 i-1 \text { for } i=2,3\right\} \\
& A=\left\{f^{*}(e)=2 i+2 \quad \text { for } i=4, \ldots .{ }^{n}\right\} \\
& 81 \quad i \quad 2 \\
& A=\left\{f^{*}(e)=2 i+3 \text { for } i=^{n}+1, \ldots, n-2\right\} \\
& 9 \quad 1 \quad i \quad 2 \\
& A_{10}=\left\{f^{*}\left(e_{i}\right)=n+4 \text { fori }=n-1\right\} \\
& A_{11}=\left\{f^{*}\left(e_{i}\right)=4 \text { for } i=n\right\}
\end{aligned}
$$

1
It can be verified that $f_{1}\left(V\left(L\left(C_{n}\right)\right)\right) \cup f^{*}\left(E\left(L\left(C_{n}\right)\right)\right)=U^{11} \quad \begin{gathered}A_{i} \\ i=1\end{gathered}=\{1,2, \ldots 2 n\} \quad$ and so $f_{1}$ is a
super mean labeling of $L\left(C_{n}\right)$. Hence $L\left(C_{n}\right)$ is a super mean labeling for line graph of cycle when $n$ is evenand $n \geq 6$.

## On Super Mean Labeling for Middle Graph of Path:

The theorem proposed in this section deals with the super mean labeling for middle graph ofpath on $n$ vertices, $M\left(P_{n}\right)$.
Theorem 3:
The middle graph of path on $n$ vertices, $M\left(P_{n}\right)$, is a super mean graph for all $n \geq 3$.
Proof:
Let $V\left(M\left(P_{n}\right)\right)=\left\{v_{i}: 1 \leq i \leq n\right\} \cup\left\{u_{i}: 1 \leq i \leq n-1\right\}$ and $E\left(M\left(P_{n}\right)\right)=\left\{e^{\prime}, e^{\prime \prime}: 1 \leq i \leq\right.$
$i \quad i$
$n-1\} \cup\left\{e_{i}: 1 \leq i \leq n-2\right\}$ with $\mathrm{e}_{\mathrm{i}}=\mathrm{u}_{\mathrm{i}} \mathrm{u}_{\mathrm{i}+1}$ for $1 \leq i \leq n-2, e^{\prime}=v_{i} u_{i}$ and $e^{\prime \prime}=$ $u_{i} v_{i+1}$ for $1 \leq i \leq n-1$

Immediately, we have that the cardinality of the vertex set and the edge set of $M\left(P_{n}\right)$ are $p=2 n-1$ and $q$ $=3 n-4$ respectively, and so $p+q=5 n-5$.
Define an injection $f: V\left(M\left(P_{n}\right)\right) \rightarrow\{1,2, \ldots 5 n-5\}$ for $n \geq 3$ as follows:

$$
f(v)_{i}=\left\{\begin{array}{cc}
1 & \text { for } i=1 \\
5 i-5 & \text { for } i=2, \ldots n
\end{array}\right.
$$

Also, $\quad f\left(u_{i}\right)=5 i-2 \quad$ for $1 \leq i \leq n-1$
And so we have,

$$
\begin{aligned}
& f^{*}\left(e_{i}\right)^{i}=5 i+1 \quad \text { for } \quad i=1,2, \ldots, n-2 \\
& f^{*}\left(e^{\prime}\right)^{i}=5 i-3 \quad \text { for } \quad i=1,2, \ldots, n-1 \\
& f^{*}\left(e^{\prime \prime}\right)=5 i-1 \quad \text { for } \quad i=1,2, \ldots, n-1
\end{aligned}
$$

Next, we consider the following sets:

$$
\begin{aligned}
& A_{1}=\left\{f\left(v_{i}\right)=1 \text { for } i=1\right\} \\
& \quad A_{2}=\left\{f\left(v_{i}\right)=5 i-5 \text { for } i=2, \ldots, n\right\} \\
& A_{3}=\left\{f\left(u_{i}\right)=5 i-2 \text { for } i=1,2, \ldots n-1\right\} \mathrm{A}_{4}= \\
& \left\{f^{*}\left(e_{i}\right)=5 i+1 \text { for } i=1,2, \ldots, n-2\right\} \mathrm{A}_{5}= \\
& \left\{f^{*}\left(e^{\prime}\right)=5 i-3 \text { for } i=1,2, \ldots, n-1\right\} \\
& \mathrm{A}_{6}=\left\{f^{*}\left(e_{i}\right)=5 i-1 \text { for } i=1,2, \ldots, n-1\right\}
\end{aligned}
$$

It can be verified that $f\left(V\left(M\left(P_{n}\right)\right)\right) \cup f^{*}\left(E\left(M\left(P_{n}\right)\right)\right)=U^{6}$

$$
A_{i}=\{1,2, \ldots, 5 n-5\} \text { and so } f
$$

is a super mean labeling of $M\left(P_{n}\right)$. Hence $M\left(P_{n}\right)$ is a super mean grapi $\hbar^{1}$.

## On Super Mean Labeling for Middle Graph of Cycle:

The theorem proposed in this section deals with the super mean labeling for middle graph ofcycle of n vertices, $M\left(C_{n}\right)$.

## Theorem 4:

The middle graph of cycle on $n$ vertices, $M\left(C_{n}\right)$, is a super mean graph if either $n$ is odd and $n \geq 3$ or $n$ is even and $n \geq 4$.

## Proof:

Let $V\left(M\left(C_{n}\right)\right)=\left\{v_{i}, u_{i}: 1 \leq i \leq n\right\}$ and $E\left(M\left(C_{n}\right)\right)=\left\{e_{i}, e^{\prime}, e^{\prime \prime}: 1 \leq i \leq n\right\}$ with

$$
\begin{gathered}
e_{i}=\left\{\begin{array}{c}
u_{i} u_{i+1} \quad \text { for } 1 \leq i \leq n-1 \\
u_{i} u_{1} \quad \text { for } i=n
\end{array}\right. \\
e^{\prime}=u_{i} v_{i} \text { for } i=1,2, \ldots n \\
i \quad v_{i}^{\prime \prime}=\left\{\begin{array}{l}
v_{i} u_{i+1} \quad \text { for } 1 \leq i \leq n-1 \\
e^{\prime}= \\
v_{i} u_{1} \quad \text { for } i=n
\end{array}\right.
\end{gathered}
$$

Immediately, we have that the cardinality of the vertex set and the edge set of $M\left(C_{n}\right)$ are $p=2 n$ and $q=3 n$ respectively, and so $+q=5 n$.

Define an injection $f: V\left(M\left(C_{n}\right)\right) \rightarrow\{1,2, \ldots, 5 n\}$ for odd and $n \geq 3$ as follows.

$$

It can be verified that $f_{1}\left(V\left(M\left(C_{n}\right)\right)\right) \cup f^{*}\left(E\left(M\left(C_{n}\right)\right)\right)=U^{18}$
$A_{i}=\{1,2, \ldots 5 n\}$
$1 \quad i=1$
a super mean labeling of $M(C n)$. Hence $M(C n)$ is a super mean labeling for line graph of cycle
when $n$ is even and $n \geq 6$.

Summary and Remarks:
Here we propose new results corresponding to super mean labeling for line and middle graph of path and cycle. All results reported here are in line and middle graph of path and cycle, $L(P n), L(C n), M(P n)$ and $M(C n)$. In future, it is not only possible to investigate some more results corresponding to other graph families but also Smarandachely super mmean labeling in general as well.
